

Authentic SaaS for Enterprise Backup

Insights

- Clumio was born in the cloud with the mission to provide a unified, data protection strategy for modern, hybrid cloud infrastructures. Clumio is designed for the enterprise and developed natively in the cloud

Facts

- Most enterprises consume public cloud resources – SaaS offerings as well as Public Cloud services. These enterprises are left with the daunting task of enforcing consistent data protection policies for all their workloads.
- They often must adopt point solutions or have no data protection at all, introducing significant risk and complexity.

“Clumio is simple to set up, easy to configure, very low cost, and it just works”

Cory Smith
CIO,CTO

Easy to Manage

Clumio provides amazing simplicity as a result of Authentic SaaS (Software as a Service). This is unlike other solutions where customers have hardware and software that they have to constantly manage. Clumio eliminates all the challenges associated with on-premise deployments - from initial sizing, constant tuning, to code upgrades, hardware break fix, and infrastructure refreshes. Clumio requires no datacenter footprint.

Predictable Costs

Clumio pricing is based on the number of VMs protected. There are no cloud bills and no egress charges. The headaches of doing capacity planning, trying to estimate storage usage, deduplication and usage rates are all gone.

Scale On-Demand

Clumio's architecture takes advantage of the elasticity and virtually limitless resources of the cloud. Resources are automatically scaled as needed to meet customer workload demands. This ensures your backups scale along with your business requirements.

Global Compliance

Clumio enables you to create a single backup policy for VMs that run in the datacenter, in a remote office, or in the public cloud. While you can set different policies based on your SLA's, there is no need to create different ones just for the location of your applications. You can manage the compliance status of backups of your entire environment from one place, instead managing each environment separately.

“From the very beginning, they baked security into everything they did. And they give you a cost model built for the cloud.”

-Award Judges

Always-On Security

Security is a core design principle of Clumio. The design includes always on, end to end encryption. The first step of a backup is to encrypt all data. In this way, data is encrypted at rest and in-flight. With Multi-Key encryption customers have full control over the access to their data.

Conclusion

Clumio dramatically changes the data protection landscape by offering a solution with Authentic SaaS:

- Easy to Manage
- Predictable Costs
- Scale On-Demand
- Global Compliance
- Always-On Security

Clumio Abstracts the Complexity of Traditional Backup Systems
